To Whom It May Concern:

GSE Rentals have selected the TRIAXYS Wave buoy and the TRIAXYS Wave & Current buoy as our primary and preferred wave buoy solutions. We have been working with AXYS and providing TRIAXYS buoys to our clients for the last 10 years with excellent results.

The TRIAXYS was selected as the ideal platform following evaluation and experience with various wave buoy manufacturers. TRIAXYS buoys use a rugged, solid-state wave sensor and feature dual primary telemetry with two-way communications for easy remote diagnostics and configuration changes. Our engineers find it easy to reconfigure the buoys to meet our clients specific project requirements. Telemetry can be reconfigured and ADCPs providing additional current data can be added or removed from the systems at will. The new Web portal service also ensure that our clients can access real time status and data from the buoys as and when required.

The technical support provided by AXYS has been of very high quality and has been part of the success for our clients' monitoring projects. I think the recent addition of a European sales and support base further enhances the support available to AXYS clients

The buoys provided by AXYS have operated according to their specifications and have provided excellent data return rates. GSE rentals strongly recommends AXYS Technologies as a leading manufacturer of wave and current buoys.

Sincerely,

Alan Cameron
